

SecuTABLET – Secure Mobile Communications

Work Securely on the Go

SecuTABLET

Drawing on the capabilities of the Secusmart Security Card, SecuTABLET combines all the features needed for users to work securely on the go with the familiar level of convenience provided by a standard Samsung Galaxy Tab S2. The Secusmart Security Card is responsible for securely encrypting the transferred mobile data as well as all the information stored on the device. In conjunction with Samsung's Knox security platform and BlackBerry's EASE (EASE Server) mobile application management (MAM) system, SecuTABLET enables users to simultaneously use both work and personal apps while meeting the most stringent security requirements.

Infrastructure

With SecuTABLET all communication between work apps and the enterprise network runs through a direct VPN connection. Mobile application management (MAM) to control and manage both work and personal apps is done via an EASE Server which is installed on customers premises.

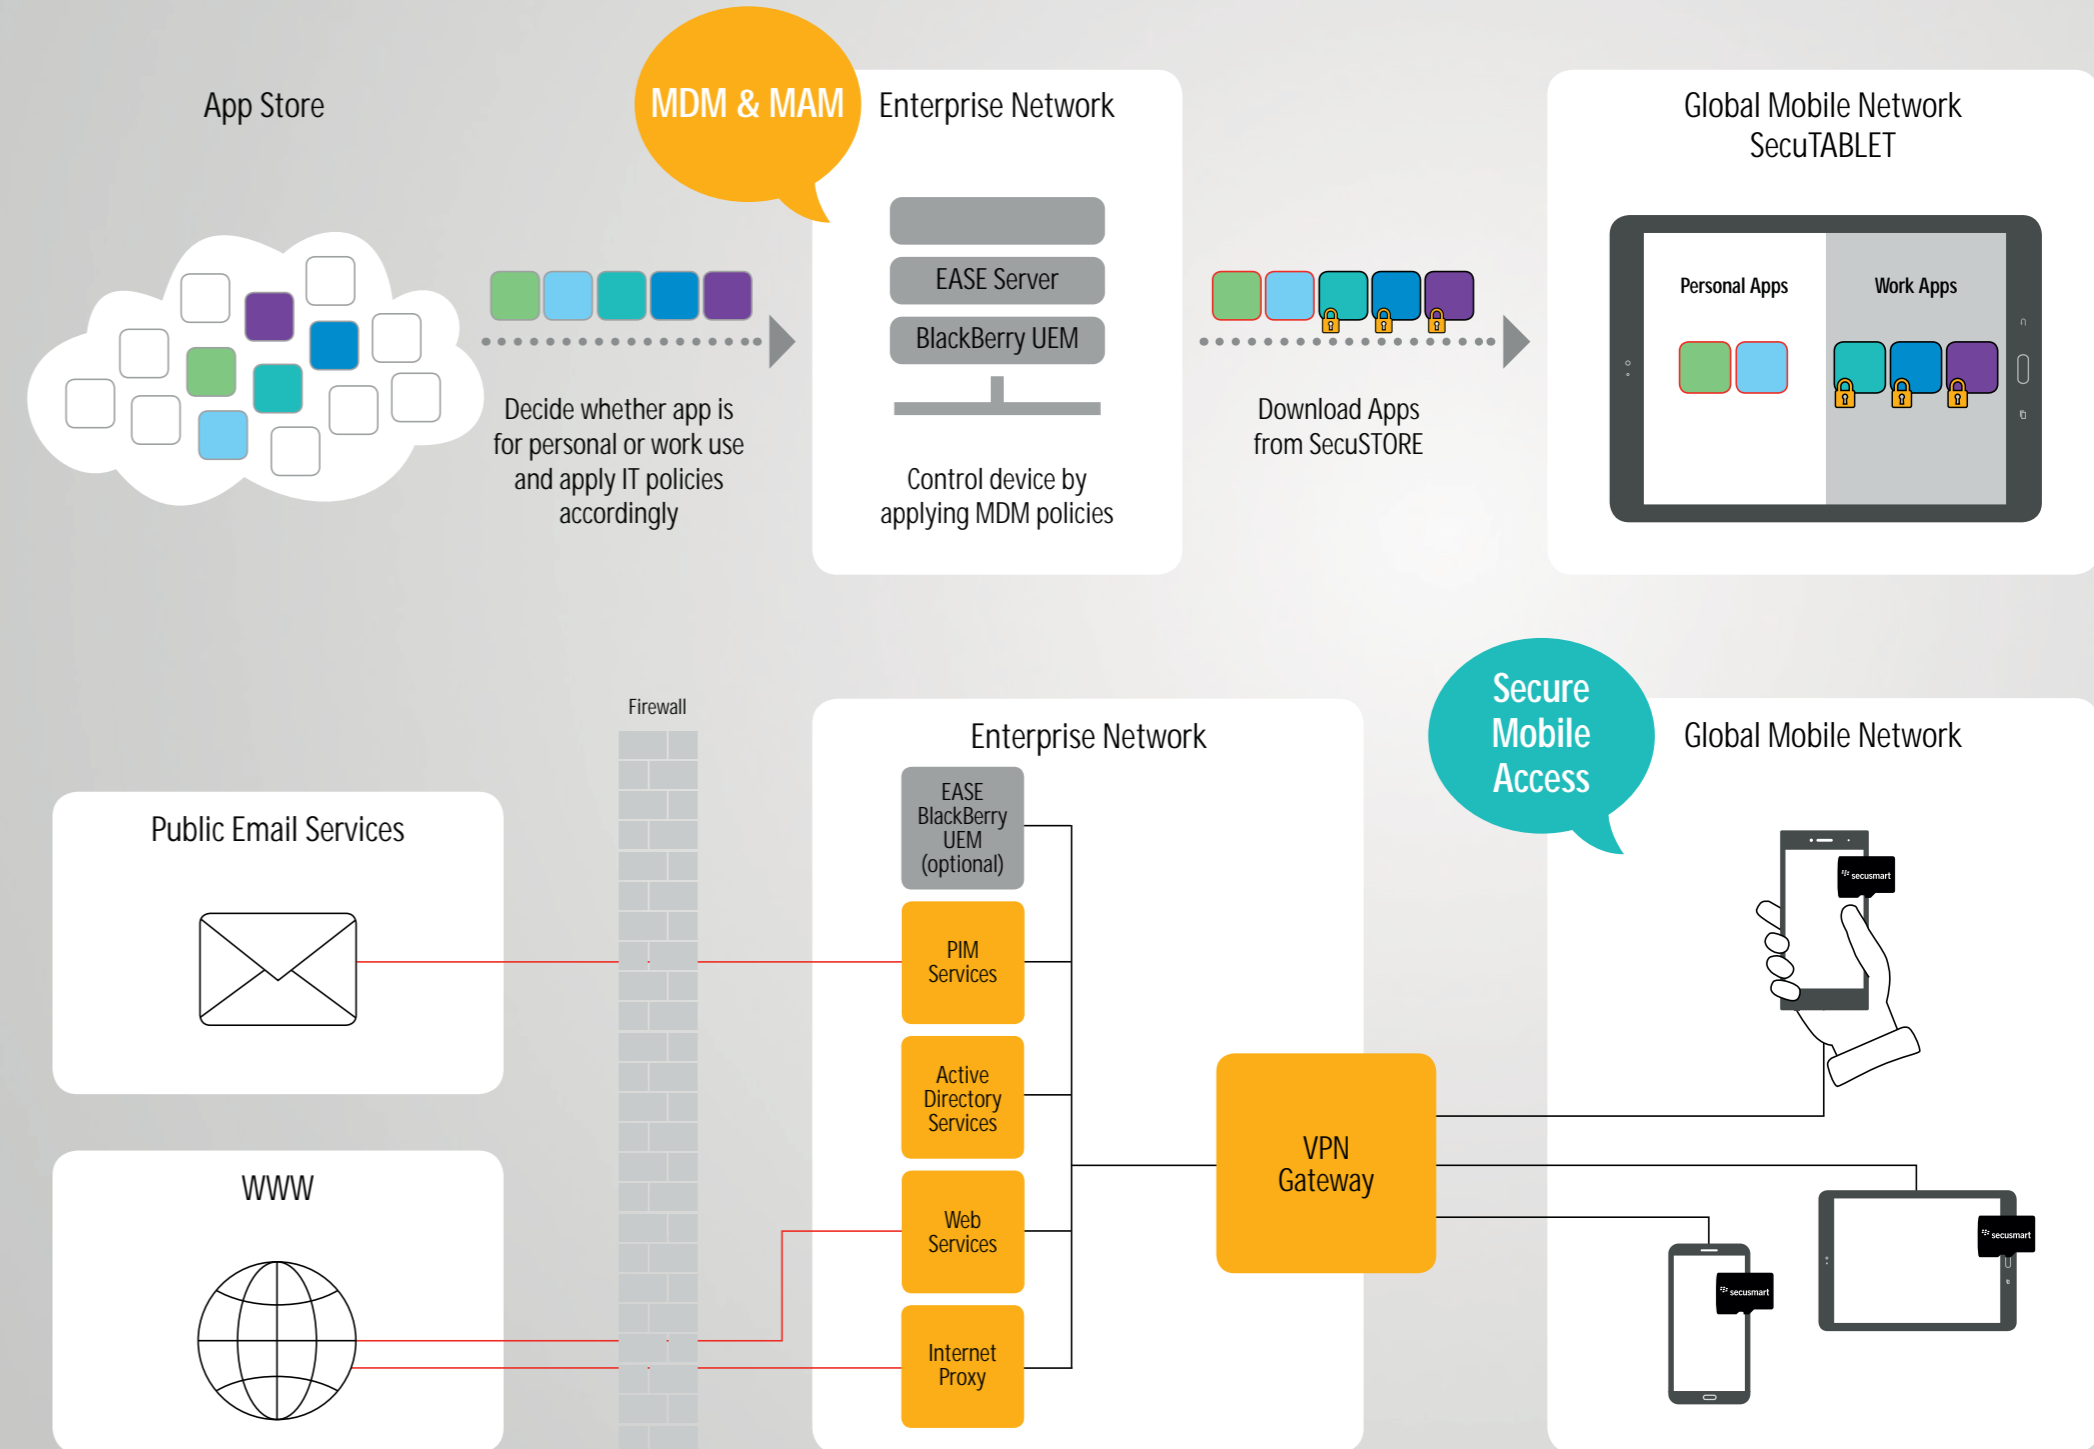

EASE Server

IT administrators use the EASE MAM server to control what apps are available for the user to download via the SecuSTORE. Depending whether an app is for work or personal use the administrator can define IT policies for each app as appropriate. In addition to the EASE MAM the BlackBerry UEM Server can be utilized to apply broader MDM functionalities.

Benefits at a Glance:

- Secure mobile access to work emails, contact, and calendar information
- Trusted MDM functionalities with BlackBerry UEM via secure VPN tunnel
- Choose from millions of Android apps controlled through EASE MAM
- Partnership with Samsung guarantees availability of latest tablets and handsets using Samsung Knox
